## Evaluating Secondary Physical Constants

| Symbol | Name | Value |
| :---: | :---: | :---: |
| c | Speed of light | $2.9979 \times 10^{10} \mathrm{~cm} / \mathrm{sec}$ |
| h | Planck's constant | $6.6262 \times 10^{-27} \mathrm{eg} \mathrm{sec}$ |
| m | Electron mass | $9.1095 \times 10^{-28} \mathrm{gms}$ |
| e | Electron charge | $4.80325 \times 10^{-10} \mathrm{esu}$ <br> G <br> Gravitation <br> constant$6.6732 \times 10^{-8} \mathrm{dyn} \mathrm{cm}$ <br> $\mathrm{gm}^{-2}$ |
| M | Proton mass | $1.6726 \times 10^{-24} \mathrm{gms}$ |

Also use $\pi=3.1415926$

Although there are only a dozen fundamental physical constants of Nature, they can be combined to define many additional basic constants in physics, chemistry and astronomy.

In this exercise, you will evaluate a few of these 'secondary' constants to three significant figure accuracy using a calculator and the defined values in the table.

Problem 1 - Bremstrahlung Radiation Constant: $\quad \frac{32 \pi^{2} e^{6}}{3(2 \pi)^{1 / 2} m^{3} c}$

Problem 2 - Photoionization Constant: $\frac{32 \pi^{2} e^{6}\left(2 \pi^{2} e^{4} m\right)}{3^{3 / 2} h^{3}}$

Problem 3 - Stark Line Limit: $\frac{16 \pi^{4} m^{2} e^{4}}{h^{4} M^{5}}$

Problem 4 - Thompson Scattering Cross-section: $\frac{8 \pi}{3}\left(\frac{e^{2}}{m c^{2}}\right)^{2}$

Problem 5 - Gravitational Radiation Constant: $\quad \frac{32}{5} \frac{G^{5}}{c^{10}}$

Problem 6 - Thomas-Fermi Constant: $\quad \frac{324}{175}\left(\frac{4}{9 \pi}\right)^{2 / 3}$

Problem 7 - Black Hole Entropy Constant: $\frac{c^{3}}{2 h G}$

Method 1: Key-in to a calculator all the constants with their values as given to all indicated significant figures, write down final calculator answer, and round to three significant figures.

Method 2: Round all physical constants to 4 significant figures, key-in these values on the calculator, then round final calculator answer to 3 significant figures.

Note: When you work with numbers in scientific notation, Ex $1.23 \times 10^{5}$, the leading number '1.23' has 3 significant figures, but 1.23000 has 6 significant figures if the '000' are actually measured to be '000', otherwise they are just non-significant placeholders.

Also, you cannot have a final answer in a calculation that has more significant figures than the smallest significant figure number in the set. For example, 6.25*5.1 which a calculator would render as 31.875 is 'only good' to 2 significant figures (determined from the number 5.1) so the correct, rounded, answer is 32.

| Problem | Method 1 | Method 2 |
| :---: | :---: | :---: |
| 1 | $2.28 \times 10^{16}$ | $2.27 \times 10^{16}$ |
| 2 | $2.46 \times 10^{-39}$ | $2.46 \times 10^{-39}$ |
| 3 | $2.73 \times 10^{135}$ | $2.73 \times 10^{135}$ |
| 4 | $6.65 \times 10^{-25}$ | $6.64 \times 10^{-25}$ |
| 5 | $1.44 \times 10^{-140}$ | $1.44 \times 10^{-140}$ |
| 6 | $5.03 \times 10^{-1}$ | $5.03 \times 10^{-1}$ |
| 7 | $3.05 \times 10^{64}$ | $3.05 \times 10^{64}$ |

Note Problem 1 and 4 give slightly different results.
Problem 1: Method 1 answer $3.8784 / 1.7042=2.27578$ or 2.28 Method 2 answer $3.8782 / 1.7052=2.2743=2.27$

Problem 4: Method 1 answer 1.3378/2.0108 $=0.6653=0.665$
Method 2 answer $1.3376 / 2.0140=0.6642=0.664$
