## Dwarf Planets and Kepler's Third Law

| Object | Distance <br> $(\mathrm{AU})$ | Period <br> (years) |
| :---: | :---: | :---: |
| Mercury | 0.4 | 0.24 |
| Venus | 0.7 | 0.61 |
| Earth | 1.0 | 1.0 |
| Mars | 1.5 | 1.88 |
| Ceres | 2.8 | 4.6 |
| Jupiter | 5.2 | 11.9 |
| Saturn | 9.5 | 29.5 |
| Uranus | 19.2 | 84.0 |
| Neptune | 30.1 | 164.8 |
| Pluto | 39.4 | 247.7 |
| Ixion | 39.7 |  |
| Huya | 39.8 |  |
| Varuna | 42.9 |  |
| Haumea | 43.3 | 285 |
| Quaoar | 43.6 |  |
| Makemake | 45.8 | 310 |
| Eris | 67.7 | 557 |
| 1996-TL66 | 82.9 |  |
| Sedna | 486.0 |  |

Astronomers have detected over 500 bodies orbiting the sun well beyond the orbit of Neptune. Among these 'Trans-Neptunian Bodies (TNOs) are a growing number that rival Pluto in size. This caused astronomers to rethink how they should define the term 'planet'.

In 2006 Pluto was demoted from a planet to a dwarf planet, joining the large asteroid Ceres in that new group. Several other TNOs also joined that group, which now includes five bodies shown highlighted in the table. A number of other large objects, called Plutoids, are also listed.

Problem 1 - From the tabulated data, graph the distance as a function of period on a calculator or Excel spreadsheet. What is the best-fit: A) Polynomial function? B) Power-law function?

Problem 2 - Which of the two possibilities can be eliminated because it gives unphysical answers?

Problem 3 - Using your best-fit model, what would you predict for the periods of the TNOs in the table?

Problem 1 - From the tabulated data, graph the distance as a function of period on a calculator or Excel spreadsheet. What is the best-fit:
A) Polynomial function? The $N=3$ polynomial $D(x)=-0.0005 x^{3}+0.1239 x^{2}+2.24 x-1.7$
B) Power-law function? The $N=1.5$ powerlaw: $D(x)=1.0 x^{1.5}$

Problem 2 - Which of the two possibilities can be eliminated because it gives unphysical answers? The two predictions are shown in the table:

| Object | Distance | Period | $\mathrm{N}=3$ | $\mathrm{~N}=1.5$ |
| :---: | :---: | :---: | :---: | :---: |
| Mercury | 0.4 | 0.24 | -0.79 | 0.25 |
| Venus | 0.7 | 0.61 | -0.08 | 0.59 |
| Earth | 1 | 1 | 0.66 | 1.00 |
| Mars | 1.5 | 1.88 | 1.93 | 1.84 |
| Ceres | 2.8 | 4.6 | 5.53 | 4.69 |
| Jupiter | 5.2 | 11.9 | 13.22 | 11.86 |
| Saturn | 9.5 | 29.5 | 30.33 | 29.28 |
| Uranus | 19.2 | 84 | 83.44 | 84.13 |
| Neptune | 30.1 | 164.8 | 164.34 | 165.14 |
| Pluto | 39.4 | 247.7 | 248.31 | 247.31 |
| Ixion | 39.7 |  | 251.21 | 250.14 |
| Huya | 39.8 |  | 252.19 | 251.09 |
| Varuna | 42.9 |  | 282.94 | 280.99 |
| Haumea | 43.3 | 285 | 286.99 | 284.93 |
| Quaoar | 43.6 |  | 290.05 | 287.89 |
| Makemake | 45.8 | 310 | 312.75 | 309.95 |
| Eris | 67.7 | 557 | 562.67 | 557.04 |
| 1996-TL66 | 82.9 |  | 750.62 | 754.80 |
| Sedna | 486 |  | -27044.01 | 10714.07 |

Answer: The N=3 polynomial gives negative periods for Mercury, Venus and Sedna, and poor answers for Earth, Mars, Ceres and Jupiter compared to the $\mathrm{N}=3 / 2$ power-law fit. The $\mathrm{N}=3 / 2$ power-law fit is the result of Kepler's Third Law for planetary motion which states that the cube of the distance is proportional to the square of the period so that when all periods and distances are scaled to Earth's orbit, Period $=$ Distance ${ }^{3 / 2}$

Problem 3-See the table above for shaded entries
